1. Introduction

ALCASAR is an authenticated and secure captive portal. This paper explains how to use and administer it.

The portal welcome page is available for any WEB browser connected on the consultation network. The URL is <u>http://alcasar</u>. It allows users to connect, to disconnect, to change their password and to load the security certificate into their web browsers. It allows administrators to access to the graphical ALCASAR Control Center (A.C.C).

For users connected on the consultation network, the following interception page is displayed when their WEB browser tries to join an Internet WEB site. This interception page is displayed in one of 6 languages (English, Spanish, German, Dutch, French

and Portuguese) depending of browsers preferences. Until the user doesn't succeed the authentication process, no network frames from their equipment can pass through ALCASAR.

For administrators, ACC is available in a cipher way (https) in two languages (English and French). After succeeding in the authentication process, the ACC is displayed in one of the three following profiles (cf. §7.1) :

- profile « admin » can use all the administration functions ;
- profile « manager » limited to the users management functions ;
- profile « backup » limited to backup log files functions.

2. <u>Network configuration</u>

On the consultation network, the equipment can be connected with multiple technologies (wired Ethernet, WiFi, PCL, etc.). This network is connected to the ALCASAR Ethernet card « eth1 ». For all these equipment, ALCASAR is the DNS, the time server and the default gateway.

<u>CAUTION</u> : On the consultation network, no other gateway should be present (verify the PLC and WIFI configurations).

The IP address configuration of the consultation network is defined during the installation process of the portal.

Example of a class C consultation network (default configuration)

- Network IP Address : 192.168.182.0/24 (sub-net mask : 255.255.255.0) ;
- Max number of equipments : 253 ;
- ALCASAR eth1 IP address : 192.168.182.1/24 ;
- Parameters of connected equipments :
 - available IP addresses : between 192.168.182.2 and 192.168.182.254 (statics or dynamics) ;
 - DNS server address : 192.168.182.1 (ALCASAR IP address) ;
 - DNS suffix : localdomain (this DNS suffix must be set in the configuration of static address equipments) ;
 - Default gateway IP address : 192.168.182.1 (ALCASAR IP address) ;
 - network mask : 255.255.255.0

2.1. ALCASAR parameters

In the « system » + « network » menu you can see ALCASAR network parameters.

a) IP configuration

	Network configuration	
INTERNET Public IP address : DNS1 : : DNS2 :	Eth0 (Internet connected interface) IP Address : 192.168.0.1/24 Gateway : 192.168.0.254	Eth1 (Private network)

Currently, these parameters cannot be modified directly with the ACC. Nevertheless, you can change them in a text console by editing the file *« /usr/local/etc/alcasar.conf* ». Once modifications have been made, activate them with the command line *« alcasar-conf.sh --apply* ».

b) DHCP server

The DHCP (Dynamic Host Control Protocol) server provides dynamically the network parameters to the equipments connected on the consultation network. You can choose one of the three following mode for this server.

				DHCP service		
Cu	rren	t mode : Full	DHCP	The different mod	les are the following	:
Full DHCP V	App	oly changes		No DHCP : The DHCP server is off. Half DHCP : The first half of LAN's equipments are in static	mode, the other are in dyn	amic mode (DHCP).
Half DHCP				Static IP addresses reservation	er mode, some static addr.	esses can be reserved (see benow).
Full DHCP	855	IP Address	Delete from list			
-		192.168.182.3	0			
		192.168.182.2	0	MAC Address	IP Address	
	_	102 169 192 4		exemple : 12-2f-36-a4-df-43	exemple : 192.168.182.10	
	_	152.100.102.4				Add

When this service is on :

- you can reserve IP addresses for equipment that need static IP addresses (servers, printers, WIFI Access Point);
- be sure that no other DHCP server is connected on your network. Or be sure to well knowing how manage multi-DHCP service (cf. §8.5a to manage the cohabitation with a A.D. © server).

2.2. <u>Consultation equipment parameters</u>

An explanation sheet for users is available at the end of this paper.

The users only need a simple WEB browser accepting **« JavaScript » and « pop-up » windows**. To be intercepted by ALCASAR, the web browser must try to access a Internet WEB site (default start page). The **proxy** parameters must be **disabled**.

a) Network configuration

Dynamic address configuration (private user equipment) :

General	8
You can get IP settings assigned automatically if your network supports this capability. Otherwise, your need to ask your network administrator for	Broadcom Corporation NetLink BCM57
the appropriate IP settings.	Veuillez entrer les paramètres réseau
Obtain an IP address automatically	 Attribution automatique de l'adresse IP (BOOTP/DHCP)
C Use the following IP address:	Configuration manuelle

Default gateway	
G. Obtain DMC annue address in demaforally	
Use the following DNS server addresses:	Récupérer les serveurs DNS depuis le serveur DHCP
Preferred DNS server	Serveur DNS 1
Alternate DNS server:	
Advanced	Autoriser les utilisateurs à gérer la connexion
	Lancer la connexion au démarrage
OK Cancel	Activer les statistiques réseau
Windows Seven »	« Mandriya & Mageia Linu

Static address configuration (servers, printers, WIFI access points, etc.) :

For these equipment, the parameters <u>must</u> be :

- default gateway : IP address of the eth1 card of ALCASAR ;
- DNS server : IP address of the eth1 card of ALCASAR ;
- DNS suffix : localdomain

es paramètres IP peuvent être di éseau le permet. 	OK Annu	Ajouter Modifier Supprimer Suffixe DNS pour cette connexion : Connexion : Connexion : Connexion : Connexion : Connexion dans le système DNS					

<u>« Windows Seven »</u>

<u>« Mandriva & Mageia Linux »</u>

For these static address equipment, be sure to set the DNS suffix to « localdomain ».

b) Add bookmark

On the Web browsers, it can be useful to add a bookmark to the ALCASAR home page (http://alcasar) in order to allow users to change their password, to disconnect or to integrate the security certificate into their WEB browsers (cf. : following §).

C) How to install the ALCASAR security certificate

Some communications between consultation equipment and ALCASAR are encrypted with SSL (Secure Socket Layer) protocol. This protocol need two certificates created during the installation process : the ALCASAR certificate and the Local Certification Authority (C.A.) certificate. By default, the WEB browsers don't know this certification authority. So they display the following alert windows when they initially connect to the portal.

Q 3.	This Connection is Untrusted			
<u>~</u> 2	You have asked Firefox to connect securely to alcasar , but we can't confirm that your connection is secure.	8	Le certificat de sécurité de ce site Web présente un problème.	
	Normally, when you try to connect securely, sites will present trusted identification to prove that you are going to the right place. However, this site's identity can't be verified.		Le certificat de sécurité présenté par ce site Web n'a pas été émis par une autorité de certification approuvée.	La cartificat da sécurité du site n'ast nas annousé l
	What Should I Do?		Les problèmes de certificat de sécurité peuvent indiquer une tentative de duperie ou	You attempted to react alcanae, but the new prevented a certificate instead by an entity that is net traited by your computer's
	If you usually connect to this site without problems, this error could mean that someone is trying to impersonate the site, and you shouldn't continue. Get me out of here!		d'interception des données que vous envoyez sur le serveur. Nous vous recommandons de fermer cette page Web et de quitter ce site.	overang uppers. 	I Understand the Risks		● Informations	
	<u>« Mozilla-Firefox »</u>		<u>« Microsoft-I.E. »</u>	<u>« Google-chrome »</u>

Although it is possible to surf, it's interesting to install the security certificate of this C.A. in browsers so that they don't display these alert windows anymore¹. To do that, click the zone « Install the root certificate » of the portal main page (« http://alcasar »). For each web browser, follow the following procedure :

onowing procedure	•			
	ی 🕑	Downloading Certificate	\odot \odot \otimes	ALCASAR Control Center

		Ø Cancel	√ ок	

<u>« Mozilla-Firefox »</u>

Konqueror

Your captive portal main page

1 You can avoid this manipulation either in buying and including in ALCASAR an official certificate which is known by all web browsers (see \$8.4), or in disabling the encryption of authenticating flow via the script « alcasar-https.sh {--on|--off} ». Disabling the encryption of authentication flow implies you totally master your consultation network (see \$11).

Install ALCASAR AC Cer

« Internet Explorer 8 » et « Safari »

«Google chrome»: Google Chrome save the certificate locally (« certificat_alcasar_ca.crt »). Select « preferences » in the configuration menu, then « advanced options », then « manage certificates » and then « import » in the tab « Authorities ».

d) Time synchronization

ALCASAR includes a network time server (« NTP » protocol) allow you to synchronize equipment connected

on the consultation network. Thus, on Windows or on Linux, you can define ALCASAR as the time server by right clicking on the clock of the desktop. Write « alcasar » on Linux and « alcasar.localdomain » on Windows.

Note: since V2.4, all the Internet NTP flows from consultation equipment are intercepted and redirected to ALCASAR.

Managing equipment 3.

You can see the list of equipment connected on the consultation network the ACC (menu « system » + « activity »).

	ieu (ieu)				
	AI	CAS	AR		You can also click on his name to view his parameters

4. Managing users

ACCUEIL

SYSTÈME

Créer un usager Éditer un usager

Créer un groupe Éditer un aroupe

Importer / Vider

Exceptions

You can manage users via ACC after a successful authentication (menu « AUTHENTICATION »). You can :

- create, search, modify and remove users or group of users;
- create a quick ticket (voucher). Only main attributes are shown and are already configured AUTHENTIFICATION (example : the expiration date is fixed to the day after) ; Créer un ticket rapide
 - import user names via a text file or via an users database backup file ;
 - empty the users database :
 - define trusted equipment allowed to connect to Internet without authentication (exceptions).

Generally, in order to minimize the administration load, it's interesting to manage group of users instead of each user. For that, the first thing to do is to define the list of group to create.

4.1. Creating a user group

When you create a group of users, you can define the attributes of all the users of this group. These attributes are enabled only if they are not empty. Thus, let the attribute empty, if you don't want to use it. Click the attribute name to see a help popup.

Already created ground	Create a group	Case ser	The name can't have nor accent nor special characters. nsitive (« group1 » and « Group1 » are two names of different groups).
Throady croated group(s	The group not to empty		
Group nam Members of group (separate by a 'space' or a 'carriage return		After thi week	Expiration date s date, the members of this group can't connect. A a fater this date, the users will be automatically deleted*. Click on the zone to see a calendar.
Expiration date := •			Maximum time of connection
Maximum time of connection	S. T	This ti	ne of connection is not linked with the number of sessions. Thus, the
(in seconds)			user can use it as he wants (in one or in multiple times).
$\frac{\text{Maximum time for a session}}{(\text{in seconds})} = \mathbf{I}$	S •		
Maximum time of connection per day			Limits of time
(in seconds) := •	s •	1	When one of these limits is reached, the user is disconnected
Maximum time of connection per month			······································

4.5. <u>Importing users</u>

In the ACC (menu « AUTHENTICATION », « Import ») :

a) From a backup of users database

When you import a backup of users database, the current database will be emptied. As this running database has to be given in case of investigation, a backup is automatically seed (see §7 to retrieve this backup).

b) From a text file (.txt)

This function allows you to quickly add users to the current database. This text file must be structured like this : one user login per line followed or not with a password separated with a space. Without a defined password, ALCASAR creates one randomly. This file can come from a spreadsheet application :

- from the « Microsoft office suite », record the file in format « Text (DOS) (*.txt) »;
- from the « LibreOffice office suite », record the file in format « Text CSV (.csv) » removing separators (option « edit filter parameters »).

Once the file is imported, ALCASAR creates each new account. If the login name already exists, the password is just changed. Two files in format « .txt » and « .pdf » including login names and passwords are created and saved in the directory « /tmp » (during 24 hours). These files are available in the ACC.

Import from a text file ('	In order to ease the m	anagement of new users, you can
In this file, you must write only the user login one below the other.	define the You can define	ir group of ownership. a group which already exist.
File (.txt) : Parcourir Define their service (optional) :	For each import job, a f	ile including the login names and the
Define their group (advisable) :	20130120-115540-users (ttt - pdf) password is shown de	uring 24 hours (format « txt » and
		« pui »).

4.6. <u>Emptying the users database</u>

This functionality allows you to remove all the users in one click. A Reset the users database backup of this database is automatically performed. See §7 to In order to impute the last connections, the actual users database will be automaticly saved. retrieve the backup. See §4.5.a to re-inject it. Send

4.7. <u>Authentication exceptions</u>

By default, ALCASAR is configured to stop the network flows from equipment without an authenticated user. Nevertheless, you can allow some flows in order to :

- allow antivirus softwares (and operating systems) to update themselves automatically on the Internet editor sites;
- access without authentication a server or a security zone (DMZ) situated behind ALCASAR ;
- allow some equipment not to be intercepted ;
- allow the recording of the Seven licenses on the Microsoft site ;
- keep the Windows icon *"Internet access" on*, even if nobody is connected. See §12.2

a) Allow network flows to trusted sites or trusted domain names

enabled the protocols filtering (see § 5.2.c), the filter rules are applied on these trusted sites or trusted domain names.

b) Allow network flows to trusted IP addresses or trusted network IP addresses

Gérez ici les adresses IP de systèmes ou de réseaux pouvant être joints sans authentification								
Commentaires								
my_web_server								

In this window, you represent IP addresses or network equipment (for example DMZ). The protocol filtering (see § 5.2.c) has no effect on the addresses reported here.

C) Allow equipment trust consultation

It is possible to allow some equipment to cross ALCASAR consultation without being authenticated. To do this, simply create a standard user whose login name is the MAC address of the equipment (example: 08-00-27-F3-DF-68) and the password is "password". You can enjoy some of the features associated with each user as rate limiting example. It should be borne in mind that in this case, traces of connection to the Internet will be charged to the equipment (not a user). This operation requires to be approved by the responsible body of SSI.

Having said equipment trust, ungroup it via the menu "System" + "Activity" that consideration be immediate.

To enhance the display of only the MAC, you can add user information in the "user info" menu (ie: first name).

Exploitation documentation

5. Filtering

FILTRAGE ALCASAR has three optional devices filter:

- Domaines et URLs a filter domain names, URLs and search engine results;
- Réseau a stream filter network for blocking some network protocols;
- Exceptions antivirus on the flow WEB.

The first two filtering devices are disabled by default. They were developed at the request of organizations likely to welcome young people (schools, colleges, recreation centers, etc.)..

5.1. Filtering domain names, URLs, and the results of search engines

The filter can be compared to the control mechanisms school / parental leave. It allows you to block access to domain names and URLs referenced in a blacklist. ALCASAR operates blacklist drawn up by the University of Toulouse. This "blacklist" was chosen because it is distributed under a free license (creative commons) and its content refers to France. In this list, the domain names (eg www.domaine.org) and URL (eg www.domaine.org/rubrique1/page2.html) are classified by categories (games, astrology, violence, sects, etc.). The management interface allows you :

- to update this list and define the categories of sites to block;
- to rehabilitate a blocked site (eg a site that was banned was closed and purchased);
- to add sites or URLs that are not known to the blacklist (CERT alerts, local regulations, etc.).

a) Enable and disable filtering

Activer la nouvelle version (Temps es

Rejeter

C) Modify the blacklist

Otherwise, discard it.

b) Update the blacklist

You can choose to filter categories. You can restore or add sites to the« blacklist ».

		adult

Entrez un nom de domaine par ligne (exemple : .domaine.org)				Entrez une URL par ligne (exemple : www.domaine.org/perso/index.htm)					Info: if you test screening and rehabilitation, consider clearing the cache browsers.

d) Special filtering

Two special filters are available in this menu. The first block URLs containing an IP address instead of a Filter les URLs contenant une adresse IP au lien d'un nom de domaine (ex: http://25.56.38.59/index.htm domain name. The second allows you to exclude the rour Youtube, créez un ID et entre le ici: results of search engines links may not be suitable for Enregister les modifications minors (function "safesearch"). This second filter is compatible with "Google", "Yahoo", "bing" and "metacrawler". This filter transforms the Google "https" requests in "http" requests.

This filter can work with 'YouTube' long to get an identifier Option A: ajouter une nouvelle règle d'en-tête HTTP follows: Modifiez votre filtre de matériel ou vos paramètres de serveur proxy pour que tout le trafic sortant vers youtube.com contienne l'en-tête HTTP personnalisé suivant. L'ID à utiliser dans la configuration de l'en-tête HTTP, écrit ci-dessous, est propre au réseau de votre établissement scolaire. Si votre établissement est bloqué au niveau du quartier, cet en-tête HTTP sera propre au réseau du quartier. YouTube as on http://www.voutube.com/education signup. Once YouTube account is created, copy the identifier assigned to you X-YouTube-Edu-Filter:kV Tm6q

in the management interface ALCASAR and save the changes.

5.2. Filtering network flows

(ID)

ALCASAR includes a filter module to allow only network flows deemed necessary.

a) Antimalware flow WEB

ALCASAR operates free product "clamav" to analyze and filter the flow of web pages within the network consultation. It is enabled by default and filters out

viruses and spyware (keyloggers, adware). Update its knowledge base is performed automatically every two hours. You can test its operation in attempting to retrieve a test file located at the URL: http://eicar.org/anti_virus_test_file.htm

b) IP address filtering or network address

C) Filtering protocols

When this filter is not enabled, a user authenticated by the portal can expl access it is wide open). All the actions of authenticated users are traced a used.

When the filter module is enabled, only the HTTP protocol is enabled blocked. It is possible from this restrictive mode, open, one by one, the ne list of standard protocols is presented by default. You can enrich it.

Le filtrage réseau est actuellement activé

- ICMP: to allow for example the command « ping ».
- SSH (Secure SHell) : to allow remote connections secure.
- SMTP (Simple Mail Tranport Protocol): to allow sending email. from a dedicated client (outlook, thunderbird, etc.).
- POP (Post Office Protocol) : to allow mail clients dedicated to recover (increase) the email.
- HTTPS (HTTP secure) : to allow inspection of secure Web site.

ntrez une adresse IP pa 192 . 168 . 182 . 154

5.3. <u>Filtering exceptions</u>

With the menu "exception" you can define the IP addresses of consultation network that don't be filtered (domain name, URL and search engines). The Energister les modifications malware filter remains active. This capability is for management staff, adults, teachers, etc..

6. Access to Statistics

The interface statistics are available, after authentication, the management portal page (menu "statistics."

Menu This interface provides access to the following information: CCHEH SYSTÈME

- number of connections per user per day (update every night at midnight);
 - connection status of users (updated in real time); •
 - daily load of the portal (updated every night at midnight); •

7. Backup of connection traces

The menu "Backup" from the management interface present in the first two columns, the log files produced by ALCASAR to enable archiving ("right click" on the file name, then "save target as"). A third column contains the archives of configuration used for relocation of a gate due to a failure or a hardware change(cf. §9.4).

7.1. Logs firewall

Three families of files are available: traces of Internet connection to devices on the network consultation files (file « tracability.log »), traces related to the administration of ALCASAR Remote (file « ssh.log ») traces related to the administration of ALCASAR Remote (file « ext_acces.log »). These files are automatically generated once a week in the directory « /var/Save/logs/firewall/ » portal. Files older than one year are deleted. These files do not contain the names of users.

It is possible to generate the archive log file is currently active.

It is possible to automatically search these files. For example, whether the Internet IP address "10.10.10.10" was contacted by a station user, run the following line: : « for i in /var/Save/logs/firewall/tracability*;do gunzip -c \$i|grep 10.10.10.10; done ».

7.2. The users database

These files (in the "SQL" format) are backups of the database users including : username, password encrypted attributes and history of opening and closing session on the portal. They are generated automatically, once a week, in the directory « /var/Save/base/ » portal. You can generate a backup at any time. Files older than one year are deleted. They can be reinjected (imported ALCASAR (§ 4.5). They are also in a relocation portal (cf. §9.4).

7.3. If Judicial Inquiry

In the context of a criminal investigation, the law enforcement officials may ask you to trace connections of your users. You just have to provide the database file users ("radius-****.sql") and the traces of Internet connections (" *tracability.log-***.gz* ") corresponding to the week covering the date of the offense. By correlating the information in these files, investigators can know exactly what such users, from such a position, is connected as day such a system by exploiting protocol. Investigators are asking if the corresponding files in the current week, creating an immediate backup of the user base and the log file (see previous §).

8. Advanced Features

8.1. <u>Administration Account Management</u>

ALCASAR PC has two system accounts (or Linux accounts) that were created during the installation of the operating system:

- « root » : This is the account of system administration ;
- « sysadmin » : This account allows you to take remote control of the system securely (cf. § next).

Alongside these two "system" accounts, "management" accounts have been defined to control functions through the center ALCASAR graphical management. These "management" accounts may belong to three profiles:

- « admin » : accounts associated with this profile can access all the functions of the management center. A first account linked to this profile was created during the portal installation (see installation doc);
- « manager »: accounts associated with this profile can only access management functions for users and groups (cf. $\S4$);
- « backup » : accounts associated with this profile can only access backup and archiving log files (cf.§7).

You can create as many accounts as you want management in each profile. To manage these management accounts. use the

« alcasar-profil.sh » as « root » :

- *alcasar-profil.sh --list*: to list all the accounts of each profile
- *alcasar-profil.sh --add* : to add an account to a profile
- *alcasar-profil.sh --del*: to delete an account

Journaux du pareteu (Firewall)	Base des usagers
tracability.log-20120325.gz (254.64 Ko)	
tracability.log-20120310.gz (309.07 Ko)	radius-2012-03-26-04h45.sql (1.36 Mo)
tracability.log-20120304.gz (278.64 Ko)	radius-2012-03-19-04h45.sql (1.35 Mo)
tracability.log-20120226.gz (238.23 Ko)	radius-2012-03-12-04h45.sql (1.34 Mo)

Sauvegarder le fichier actif de traces	₹	Exécuter	

• *alcasar-profil.sh --pass* : to change the password of an existing account

8.2. <u>Secure administration through Internet</u>

It is possible to connect to a remote ALCASAR using an encrypted stream protocol ("SSH" - Secure SHell). For example, an administrator who seeks to administer, through the Internet, a ALCASAR or equipments on the network consultation. At first, you need to activate the service "SSH" on ALCASAR (menu "system" and "network"). You must know the IP address of the Internet Box2.

a) Box Configuration

It is necessary to configure it. Lets map "SSH" protocol to ALCASAR ETH0. To "anonymize" the flow SSH on the Internet, we decided not to use the default port number (22), but another (52222). You can keep the default number or choose a new one.

Adresses IP statiques :				In the m
Nom	Adresse IP	Adresse MAC	Supprimer	address
Portail captif 💌	192.168.1.2		Û	"Equipme
→ Ajouter				Paramètres a

In the menu "Advanced settings", create an entry for the IP address of eth0 ALCASAR (Internet side). Same menu "Equipment Management".

Paramètres av	/ancés	
DHCP • NAT/PAT	• DNS • NTP • UPnP • DynDNS • DMZ • Routage	1

Port interne

52222

ort externe

Cette page vous permet de créer des règles de NAT/PAT. Ces règles sont nécessaires pour autoriser une communication initiée depuis Interne à atteindre un équipement spécifique de votre réseau. Vous pouvez aussi définir le(s) port(s) sur lequel cette communication sera acheminée. Avertissement : Assurez-vous de ne pas avoir filtré ces ports dans le pare-feu.

Protocol

TCP

In the menu "NAT / PAT," complete the^{Avertisser} following fields and save: The external port (52222 in this case) is the port on which ssh frames arrive. Internally, ALCASAR SSH listening on its default port (22).

• <u>Case of a « freebox »</u>

In the menu "router", configure port forwarding.

b) Administration ALCASAR text mode

You can log on to the remote operator ALCASAR the Linux account "sysadmin" created during the installation of the system. Once connected, you can use the administrative commands (see § 12.1). You can become "root" via the command "su".

Application

Service

- On Linux, install "openssh-client" (it is also possible to install "putty") and run the command « *ssh -p 52222 sysadmin@w.x.y.z* » (replace « w.x.y.z » by the public IP address of the BOX2 and adapt the "external_port" by the listening port number of the BOX2 (52222 in our example). You can add the "-C" option to activate the compression algorythme.
- On Windows, install "Putty" or "putty-portable" or "kitty" and create a new session:

CONFIGURA	TION DE MA FREEBOX
Vous souhaitez activer ce service:	Activer

1

click on "Open", accept the server key and log on as "sysadmin".

C) Administration ALCASAR in graphical mode

The goal now is to redirect the flow of Web browser of the management station in an SSH tunnel to ALCASAR to graphically administer. To create the tunnel:

Options controlling

Local ports accept connect ote ports do the same (SSH-2 only)

192.168.0.1:443

Remote

arded ports

d) Administration of network equipment consultation

Following the same logic, it is possible to administer any equipment connected to the network consultation (WIFI access points, switches, LDAP / AD, etc..).

- On Linux, run the command: « ssh -L 10000:@IP_équipement:Num_Port -p 52222 sysadmin@w.x.y.z ».
- « @IP_équipement » is the IP address of the equipment to administer.« NUM_PORT » is the administration port of this equipment (22, 80, 443, etc.).
- On Windows, enter the IP address and port of the equipment in the form "Destination" of "Putty".

To administer via ssh, run <u>« ssh login@localhost:10000 »</u> To use a web interface, connect your browser to the URL: « http(s)://localhost :10000 ».

e) Operation of SSH tunnel using a key pair (public key / private key)

This paragraph, although not essential, will increase tunnel safety administration through the authentication of the administrator's private key.

- generate a key pair (public key / private key)
 - Windows with « puttygen »

PuTTY Key Generator	PuTTY Key Generator
File Key Conversions Help	File Key Conversions Help
KeyNo key. Generate a public/private key pair Generate	
Load an existing private key file Load	The keys are now created.
Save the generated key Save public key Save private key	- Enter a comment representative in "Key-comment";
Parameters Type of key to generate: O SSH-1 (RSA) O SSH-2 RSA O SSH-2 DSA Number of bits in a generated key: 2048	 Enter and confirm the passphrase in the "Key passphrase"; Save private key by clicking on "Save private key"; Select and copy the public key (right click)

• Linux with« ssh-keygen »

In your home directory, create the directory « .ssh » if there is not. From this, generate your key pair(« ssh-keygen -t rsa -b 2048 -f id rsa »). Command « cat id rsa.pub » can see (and copy) your public key.

richard@rexy ~]\$ mkdir .ssh richard@rexy ~]\$ cd .ssh/ richard@rexy .ssh]\$ ssh-keygen -t rsa -b 2048 -f id_rsa enerating public/private rsa key pair. inter passphrase (empty for no passphrase): inter same passphrase again: our identification has been saved in id_rsa. our public key has been saved in id rsa.pub.

.ssh]\$ cat id_rsa.pu

ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAyL4yMM8B018Quusv11q/V 3kF2wvhuHzmNmH9ITFTALwHPHA91WnxlcDPE9DPR7FPqrEZf/uT84C2G o7d/IX+/JyP1VXoUdXaZ9wjtusU3SVWSr6o9NXmbZqo0gzrGpjN7Vfu5 npCrDQGfuq6PIm06AQCJQkySm0XDIGFVr4r5Zbw==

- Copy the public key to the remote portal:
 - run the following command to directly copy your public key to the remote server:
 - ssh-copy-key -i .ssh/id_rsa.pub sysadmin@<@IP_interne_consultation>
 - Enter your password and your public key is copied to the architecture *sysadmin/.ssh/authorized_keys* automatically with the correct permissions.
 - Another method: log on via remote ALCASAR "ssh" as "sysadmin" and run the following commands:
 « mkdir .ssh » puis *« cat > .ssh/authorized_keys » ;*
 - copy the contents of the public key from the clipboard ("Ctrl V" for Windows, middle mouse button for Linux) type« Entrée » and « Ctrl+D » ;protect the directory: « *chmod 700 .ssh* » and key file « *chmod 600* .*ssh/authorized_keys* » ;check the file:« *cat .ssh/authorized_keys* », log out« *exit* ».
 - Test connection from Linux: « slogin sysadmin@w.x.y.z »
- Test connection from Windows:
 - load the previous session of putty;
 - $\circ~$ on the left side, select "Connection / SSH / Auth";
 - click "browse" to select the key file;
 - select the left side Session;
 - click "Save" then "Open";
 - enter the user "sysadmin";
- the key is recognized, it remains only to enter the passphrase.
 - If you now want to deny the connection password, configure the sshd server:
 - go root (su -) and set the following options file« /etc/ssh/sshd_config »:
 - ChallengeResponseAuthentication no
 - PasswordAuthentication no
 - UsePAM no
 - restart the sshd server(« *service sshd restart* ») and close the ssh session(« *exit* »).

Encryption uses TLS associated with a server certificate and a certification authority local (AC) created during the installation. This server certificate with a lifetime limited to 4 years, you can see the expiration date in the front page of the Control Center Graphics:

Upon expiration of the certificate, you can regenerate via the command« alcasar-CA.sh ».

It will be necessary to remove the old certificate store browsers before importing / accept the new.

a) Installation of an official certificate

Since version 2.0 it is possible to install an official certificate type "intranet" Digitalix offered by some suppliers. The integration of such a certificate prevents windows security alert on browsers that have not integrated the root certificate of ALCASAR (cf. §2.2.b). Unlike certificates "Internet" certify a registered domain name with a registrar, a certificate "intranet", may certify a private IP

address or a simple name server (hostname). This corresponds to the situation ALCASAR including the "hostname" is always "ALCASAR." To gain your certificate, follow the instructions on the provider's site knowing that the web server is operated by a server ALCASAR "APACHE" with SSL module. The following example allows the integration of a certificate "intranet" generated by the supplier "Digitalix." At first, you need to run the following command on ALCASAR as "root" : openssl req -newkey rsa:2048 -new -nodes -keyout alcasar.key -out alcasar.csr This command generates two files : the private key (alcasar.key) and the certificate request (*alcasar.csr*). Copy the certificate request file on a USB key in order to copy its contents to the vendor's site. It must return a file containing your server certificate Official (*alcasar.crt*). If applicable, you must also get the intermediate CA certificate from your provider (for Digitalix, it is available here: http://www.digitalix.fr/certs/HACert-bundle.crt).

As "root", copy the three files « alcasar.key », alcasar.crt » and « HACert-bundle.crt » in your home directory (*/root*). Then perform the following operations:

- 1. *cd /etc/pki/tls* (moving certificate in the directory)
- 2. mv certs/alcasar.crt certs/alcasar.crt.old then mv certs/server-chain.crt certs/server-chain.crt.old and finally mv *private/alcasar.key_private/alcasar.key.old* (backup the old certificates)
- 3. *cp /root/alcasar.crt certs/* et *cp /root/alcasar.key private/* (copy of the official certificate and its private key)
- 4. if your provider has a intermediate CA certificate: *cp /root/HACert-bundle.crt* certs/server-chain.crt else : cp certs/alcasar.crt certs/server-chain.crt
- 5. Restart the Apache Web server via the command« service httpd restart ».

In case of problems:

- go back by reversing the operations of the second line, or you can recreate the local certificates "brand new" via the command« alcasar-CA.sh »;
- restart the Apache Web server via the command« service httpd restart ».

8.3. <u>Embedding the logo of the organization</u>

It is possible to put in place the logo of your organization by clicking on the logo at the top right corner of the management interface. Your logo will be inserted in the authentication page and in the top bar of the management interface. Your logo should be free format "png" and must not exceed the table of the share of t size of 100KB. It is necessary to refresh the browser page to see the result.

8.4. <u>Manipulation with the server certificate</u>

ALCASAR crypt exchanges with equipments on the network consultation in the following cases:

- for users: authentication request and changing passwords;
- for administrators: access to graphical control center (ACC).

	Nom d'hôte cannonique	alcasar
	Date d'expiration du certificat	May 30 23:59:59 2012 GMT
	Version du noyau	2.6.33.7-desktop586-2mnb (SMP)
l	Distribution	💝 Mandriva Linux 2010.2
h	Uptime	51 minutes
1	Utilisateurs	1
F	Charge système	0.00 0.00 0.00
		10%

b) Copy of certificate on multiple ALCASAR

If you operate several ALCASAR, it may be useful to copy the certificate from a reference ALCASAR others. If you have installed an official certificate, perform steps 1 through 5 of the previous chapter on the various ALCASAR. In the case of a certificate created during installation, copy the following files from the five reference ALCASAR others:

- for the CA : /etc/pki/CA/alcasar-ca.crt and /etc/pki/CA/private/alcasar-ca.key
- for the certificate server: /etc/pki/tls/certs/alcasar.crt, /etc/pki/tls/certs/server-chain.crt and /etc/pki/tls/private/alcasar.key

Restart the Apache Web server via the command: « *service httpd restart* ».

8.5. <u>Using an external directory server (LDAP or AD)</u>

ALCASAR integrates a module allowing to query a external directory server (LDAP or AD) located either LAN or WAN side. When this module is enabled, ALCASAR primarily uses the external directory, then in case of failure, the local database to authenticate a user. In all cases, the log files related to user events (log) are treated in the local database of ALCASAR. The management GUI of this module is as follows:

Auti	ientification LDAP					
Connexion I D&P réussie		<u>Remark</u>	<u>K</u> :			
			attributes of users located in the external directory			
Activer l'authentification LDAP:	OUI Ŧ		can not be changed via the management interface of

Password : password of the user « rldap »							
-	OU=Admin	<u> </u>	OU=Utilisateur				

It is possible to assign all users declared in an external directory (LDAP or AD) ALCASAR specific attributes (bandwidth,

concurrent session, etc.).. To do this, declare a group named "ldap" for which you set the desired attributes. It is also possible to assign attributes to a particular account ALCASAR authenticated on an external directory. To do this, create a user with the same name ALCASAR that directory.

8.6. Integration in a complex architecture (AD, DHCP external)

ALCASAR can be integrated into an existing architecture with a Windows domain, a DHCP server and a directory server LDAP or AD (see previous §).

a) Windows DNS Management

When an AD architecture is present on the network and consultation stations are hung up on Windows domain controller, they must apply to both the controller for DNS resolutions specific to Windows services and DNS of ALCASAR for Internet access. One solution is to configure the DNS ALCASAR so it redirects the DNS domain controller queries concerning. In this way, the equipment consultation are configured as single ALCASAR DNS.

The only change to make is to add the following line in the file « /etc/sysconfig/dnsmasq » :

OPTIONS= " --server=/<your.domain>/<@IP_SRV-AD-DNS> "

Example : *brock.net* domain is managed by a server AD / DNS with the IP address 192.168.182.10 is. The line to add is: *OPTIONS=" --server=/brock.net/192.168.182.10 "*

Please note that it is the domain name and not the server srv-ad.brock.net. Dnsmasq restart the service for your changes to be applied(« *service dnsmasq restart* »). Reminder: the DNS suffix 'localdomain' stations in fixed address must be present.

b) Using an External DHCP Server

Using an External DHCP Server *«/usr/local/etc/alcasar.conf »*):

- EXT_DHCP_IP=<@IP_srv_externe>
- RELAY_DHCP_IP=<@IP_interne_ALCASAR>
- RELAY_DHCP_PORT=<relay port to the external DHCP server> : (default 67)

The external DHCP server must be configured to provide stations:

- a range of IP @ corresponding to the range allowed by ALCASAR (default 192.168.182.2-254/24);
- gateway address corresponding to the internal IP address of ALCASAR (default 192.168.182.1); DNS suffix "localdomain";
- the @ DNS server IP -> IP address internal ALCASAR (default 192.168.182.1);
- the @ IP of the time server (NTP) -> the internal IP address of ALCASAR (default 192.168.182.1) or the domain controller (to avoid temporal drifts, also to ensure the implementation position automatic time therefor to a server matched to the Internet or more simply ALCASAR).

8.7. Encryption of log files

ALCASAR can automatically encrypt log files of firewall, http proxy "squid" and access to the management interface. For this, it uses the asymmetric algorithm (GPG public key + private key). Providing the private key to a responsible body for your receiver, you protect administrators ALCASAR charges change these log files. In case of inquiry, simply provide log files and encrypted private key for decryption. The procedure for activating the encryption is as follows:

Printscreen	Comments	To do	
Bienvenue sur alcasar-rexy Kernel 2.6.27.37-desktop-1mnb on an i686 × tty1 alcasar-rexy login: root Password: Last login: Sun Dec 20 19:12:49 on tty1 alcasar-rexy: ^{*#} rngd -r /dev/urandom alcasar-rexy: ^{*#}	- Log on as « root ». - Start the entropy generator.	<mark>rngd -r /dev/urandom</mark>	
<pre>alcarar-resy: " g pp -gen-key)</pre>	 Generate the key pair (public key + private key). Choose the algorithm, the size and durability of the keys (no expiration). Choose a user name and passphrase. 	<i>gpggen-key</i> info: The user name must not contain spaces. This name is included under the term <username> later in this procedure.</username>	
alcasar-rexy:~# killall rngd	- Stop the entropy generator.	killall rngd	
klcasar-rexy:"8 gpgarworexport-secret-keys ossi-organisme > alcasar_key.pr iv alcasar-rexy:"8 ls -al alcasar_key.priv -ru-ru-r 1 root root 1850 2009-12-21 00:56 alcasar_key.priv	 Export the private key. Copy this to an external media. <pre>slcasar-rexy:"# rn -f alcasar_key.priv wlcasar-rexy:"# gpg -delete-secret-key ossi-organisme gpg (GmUPG) 1.4.9: Copyright (C) 2008 Prec Software Poundation, Inc. This is free software: you are free to change and redistribute it. There is NO WARRANTY, to the extent permitted by law. sec 1024D/COD0D6EB 2009-12-20 ossi-organisme Enlever cette clé du porte-clés ? (o/N) o C'est une clé secrète ! - faut-il vraiment l'effacer ? (o/N) o</pre>	- Delete the previously generated keys - Delete the private key from GPG keyring	rm -f alcasar_key.priv gpgdelete-secret-key <nom_utilisateur></nom_utilisateur>	
CHIFFREMENT="1" GPG_USER="ossi-organisme"	- Enable encryption by changing the variables "encryption" and "gpg_user" in the file « /usr/local/bin/alcasar-log-export.sh ».	vi /usr/local/bin/alcasar-log-export.sh info : assign the "username" to the variable « gpg_user »	

Infos :

- ALCASAR uses the keyring "root" in the directory « /root/.gnupg »;
- '*gpg*—*list-key*' : allows to list all the key pairs contained in this kit;
- '*gpg --delete-key* <<u>user_name></u>' : deletes a public key keyring;
- '*gpg --delete-secret-key <user_name>*' : deletes a private key keyring;
- You can copy the directory « */root/.gnupg* » on another server ALCASAR. Thus, you can use the same key and the same <username>;
- To decipher an encrypted archive: "gpg –decrypt < filename_crypt_archive>".

8.8. Load balancing connection

ALCASAR has a script to distribute connections to multiple gateways to the Internet "*alcasar-load_balancing.sh start* | *stop* | *status*". The parameters are not included in the management interface, it is necessary to modify the global configuration file "*alcasar.conf*" located under "/ *usr* / *local* / *etc*".

Associated parameters (. Cards virtual networks, weights, @ ip gateway, etc.) are defined in the following format: WANx = "active [1 | 0], @ IPx / mask, GWx, Weight, MTUX".

Interfaces are created on the fly by the script. To be active, the MULTIWAN parameter must include the "on" value or "On" position if the "Off" mode to keep "single gateway".

The frequency of the connectivity test is set by default to 30sec. Note that a value of the "FAILOVER=0" indicates a test mode without MULTIWAN connectivity gateways.

8.9. Creating a dedicated housing (appliance) ALCASAR

This chapter presents an embodiment of a dedicated housing (appliance) ALCASAR economic constraints which are miniature (mini-itx) without noise (noiseless), fan (fanless) and low energy consumption. The configuration is as follows: Case A + Case CS160 (12V integrated) motherboard AT5NM-10 (integrated Intel D525), 2GB of DDR2 memory (PC2-6400) HDD 2.5 '200GB SATA, PCI Ethernet complementary. Replacing the hard drive with a SSD 2.5 "40GB reduces the heat, remove the blower housing and thus reduce the consumption of 28W to 20W. The cost of this configuration is around 210 € (shipping included). The cost is the annual electricity consumption of 20.53 € (20 * 24 * 365/1000 * 0.1152). ALCASAR is installed via a USB drive as usual. Once deployed, the unit requires no keyboard, no mouse or screen.

8.10. <u>Bypassing the portal</u>

For reasons of maintenance or emergency, a workaround portal was created. It eliminates user authentication and filtering. Logging network activity remains active. Accountability connections is no longer assured. To start bypassing the portal, run the script « *alcasar-bypass.sh --on* ». To remove it, run the script « *alcasar-bypass.sh --off* ».

9. Shutdown, updates and reinstallation

9.1. Shutdown

Two possibilities can stop properly the ALCASAR PC :

• by briefly pressing the power button of the equipment;

• by connecting to the console as root and running the command "init 0";

When restarting the PC ALCASAR a procedure deletes all connections that have not been closed due to a stop unwanted (failure, power failure, etc.).

9.2. <u>Updates of the operating system</u>

Mageia-Linux provides an excellent mechanism to implement such security fixes (patches) on the system and its components. ALCASAR has been developed to be fully compatible with this mechanism. So, every night at 3:30, the security updates are retrieved authenticated and applied where appropriate. You are of course possible to manually initiate the update by the command « *urpmi –auto --auto--update* » as « root ».

Once the update is complete, a message may warn you that a system reboot is required. This message appears only if a new kernel (kernel) or a major library were updated.

9.3. Updates of ALCASAR

You can tell if an update is available for ALCASAR looking cover page of your management interface or by running the command «*alcasar-version.sh* ». Retrieve and untar the latest version as in a normal installation. Run the installation script (« *sh alcasar.sh --install* »), it will automatically detect the previous version and ask if you want to perform an update. During an update, the following data are given:

- network configuration;
- the name and logo of the organization;
- usernames and passwords for administrative accounts of the portal;
- based users and groups;
- blacklists primary and secondary;
- the list of sites and MAC addresses of trust;
- configuration of network filtering
- certificates of the Certification Authority (CA) and the server.

9.4. <u>Reinstallation of a portal</u>

ALCASAR incorporates a device to reinstall portal with its parameters. This can be useful when changing the PC support following a change or a hardware Sauvegarde

failure. Start generating an archive portal Créer une archive système Exécuter configuration via the management interface (menu Fichiers disponibles pour archiva "backup" + "create an archive system"). Retrieve Journaux du parefeu (Firewall) Base des usagers Archive système radius-2012-02-06-22h02.sql (5 the generated file on a USB key. Install the new radius-2012-02-05-23h23.sql (13.35 Ko) radius-2012-02-05-23h08.sql (12.37 Ko) operating system as in an initial installation. alcasar-conf-2012-02-06-22h02.tar.gz (6.15 Mo) radius-2012-02-05-23h04.sql (12.37 Ko) alcasar-conf-2012-02-05-23h23.tar.gz (6.15 Mo) Connect your USB and copy the file "archive tracability.log-20120205.gz (9.61 Ko) radius-2012-02-05-22h43.sql (15.61 Ko) alcasar-conf-2012-02-05-23h08.tar.gz (6.15 Mo) radius-2012-02-05-18h50.sql (15.61 Ko) alcasar-conf-2012-02-05-23h04.tar.gz (6.15 Mo) tracability.log-20120204.gz (13.39 Ko) system" in the directory « /*tmp* ». Retrieve and radius-2012-02-05-18h47.sql (15.61 Ko) alcasar-conf-2012-02-05-22h43.tar.gz (6.16 Mo)

untar the latest version and install the ALCASAR as in a normal installation: « sh alcasar.sh --install ».

10. Troubleshooting

This chapter presents various diagnostic procedures in different situations or questions encountered. Orders (emphasis in yellow) are engaged in a console as "root".

10.1. Network connectivity

- test the status of network cards: : run the commands « *ethtool eth0* » and « *ethtool eth1* » to verify the status of • the two network cards (« *Link detected* » and « Speed » fields example);
- test connection to the output router : start a « ping » to the router's @IP Output (Box F.A.I). In case of failure, check the network cable, the interface configuration eth0 (*ifconfig eth0*) and router status;
- test connection to external DNS servers : start a « *ping* » to the DNS server's @IP . In case of failure, change • servers:
- test the internal DNS server(dnsmasq) : initiate a request for name resolution (ex. : dig www.google.fr). In case of failure, check the configuration file "dnsmasq" (*cat /etc/dnsmasq.conf*). To verify the proper functioning of the service or redirections (in the case of an internal DNS server), you can uncomment the first line of the file OPTIONS /etc/sysconfig/dnsmasg to view requests and responses (tailf /var/log/dnsmasq/queries.log). Warning : this is relatively resource intensive. It is preferable once validated, this option is commented on again. To be taken into account, these changes always require restarting the service dnsmasg : « service dnsmasg restart »;
- test Internet connectivity: run the command « wget www.google.fr ». If successful the front page of Google is downloaded and stored locally (index.html). The menu "system / service" management interface reports this test: ✓ Lien Internet : actif
- connectivity test equipment to consultation : you can test for the presence of a device on the network via the command consultation « *arping -I eth1 @ip_quipment* ».

You can view all devices on the network by running the consultation « *arpscan eth1* » ; 00:1C:25:CB:BA:7B 192.168.182.1 00:11:25:B5:FC:41 192.168.182.25 00:15:77:A2:6D:E9 192.168.182.129

You can view the network packets from the network consulting installing tool « tcpdump » (urpmi tcpdump) and running the command *« tcpdump -i eth1 »*.

10.2. Available disk space

				Systemes de tichiers montes			
	Point	Туре	Partition	Utilisation	Libre	Occupé	Taille
If disk space is not enough, some modules may no longe	1	ext3	/dev/sda1	5696 (196)	383,34 Mo	547,34 Mo	980,49 Mo
in alon opace to not chough, come modules may no tonge	/tmp	ext3	/dev/sda6	396 (196)	1,03 Go	33,77 Mo	1,12 Go
work For example the proxy server "Squid" stops when i	home	ext3	/dev/sda7	396 (196)	1,07 Go	33,46 Mo	1,10 Go
work. For example, the proxy server bequite stops when I	/var	ext3	/dev/sda8	0%	62,74 Go	251,01 Mo	66,35 Go
can no longer feed its log files. You can check the available	<u>د</u>			Totaux : 1%	65,21 Go	865,59 Mo	69,53 Go

disk space (especially partition /var) :

- in graphical mode via the homepage of the management center;
- in text mode, using the command $\ll df \gg$

In case of excessive reduction of this space, delete old log files after they have been archived (directory /var/Save/*).

10.3. ALCASAR server services

To fulfill these tasks, ALCASAR operates several services server. Stopping one of them can prevent ALCASAR run. It is useful to know how to diagnose why a service is stopped. Run the command « ps fax » and verify that the web server apache '("httpd") is running. If necessary, start with the command « service httpd *start* ». In case of failure, view the log report error via the command « *tailf /var/log/httpd/error.log* ».

The operating status of other services is displayed in the management interface(menu « system/services ») :

Status	Nom du services	Actions
~	radiusd	ArrêterRedéma
~	chilli	Arrêter Redéma
~	dansguardian	Arrêter Redéma
~	mysqld	ArrêterRedéma
S	souid	Arrêter Redéma

You can stop or restart via the management interface or via the command "service service_name start / stop / restart". In case of failure, check the system log file (*tailf/var/loa/messages*) why they can not get started.

10.4. Connectivity of the equipment of consultation

On the management interface (under "System / Activity"), make sure that your equipment consultation have correct network settings (MAC address / IP address). If this is not the case, delete the old address by registered ALCASAR and reconfigure equipment. Consultation on equipment :

ē					
S	#	adresse IP	adresse MAC	usager	Action
1	1	192.168.182.130	00-0B-6C-3A-55-4D		Déconnecter
T	2	192.168.182.22	00-1A-A0-2F-10-DB		Déconnecter
	З	192.168.182.15	00-15-58-E7-24-BA	-	Supprimer
	4	192.168.182.10	00-15-58-E7-5B-22		Déconnecter

•

- check the network settings: run « *ipconfig /all* » on Windows, « */sbin/ifconfig* » on Linux ;
- if they are not correct, change them. For equipment in dynamic mode, restart an address request : • « *ipconfig /renew* » on Windows, « *dhclient eth0* » on Linux.

If the interface is not configured, check the cables and make sure that the DHCP frame pass over the network (using the frame analyzer "wireshark" for example). On ALCASAR console, you can see the incoming requests by running the command « *tailf /var/log/messages* » or displaying the terminal N°12 (<Alt> + F12).

29 22:31:27 alcasar coova-chilli[2299]: chilli.c: 2694: New DHCP reques ec 29 22:31:27 alcasar coova-chilli[2299]: chilli.c: 2661: Client MAC=08-0 -27-E7-EA-89 assigned IP 192.168.182.129

- Test connection to the portal : start a ping to the IP address of ALCASAR. In case of failure, check cable and configure the network interface.
- <u>Test name resolution</u>: On Windows, run « *nslookup alcasar* ». On Linux, run « *dig alcasar* ». The result should be the IP @ ALCASAR. In case of failure, check gu'ALCASAR is indeed the DNS server equipment consultation
- Management Interface : Open a browser on equipment consultation and try to log on ALCASAR (http://alcasar).
- Test Internet Connection : Test the connection to a website. ALCASAR must intercept you and submit the authentication window.

10.5. Connection to ALCASAR with a serial terminal

It may be useful to let the server ALCASAR without a screen and keyboard. Below is a short tutorial to connect a serial terminal (thank you Igor Popowski) :

File /etc/inittab :		File /etc/securetty :				
•	save the original :	•	save the original : <mark>cp /etc/securetty /etc/securetty.save</mark>			
•	edit the file : vi /etc/inittab before this line : « # Single user mode », add the following lines: #connexion au terminal serial s0:2345:respawn:/sbin/agetty -L 9600 ttyS0 vt100 -f /etc/issue then save « Esc »then « :wq! »	 edit the file : vi /etc/securetty add one of the two following line at the end of file: ttyS0 if using a 9-pin serial port ttyUSB0 if using a Serial / USB and save «Echap» and « :wq! » run the command« init q » to account for this change. 				
	To see the output of the boot in GRUB, edit the file <i>/boot/grub/menu.lst</i> save the original: <i>cp /boot/grub/menu.lst /boot/grub/menu.lst.save</i>					

in the section 'title linux' after adding vga=791 to end of line : console=tty0 console=ttyS0,9600n8 by standard serial port console=tty0 console=ttyUSB0,9600n8 in USB port

Connect the PC administration ALCASAR with a null modem cable to the serial port com1 (or via a serial / USB). Set "putty" to use this serial com1 in vt100.

10.6. Troubleshooting

This chapter presents the feedback from organizations who have found the solution to the problems identified.

a) The images do not appear on some sites

When filtering domains and URLs is enabled, the default filter ALCASAR web links without domain name (IP address to pure). Thus, the web pages containing this type of link are shown only partially. Two solutions to avoid this behavior: remove the "IP" blacklist (cf. § 4.1.b) or register the IP addresses contained in these web links as "rehabilitated site" (cf. § 4.1.c). For example, the website "leboncoin.fr" link all images to the following IP addresses: 193.164.196.30, .40, .50 and .60 and 193.164.197.30, .40 and .50.

b) Navigation impossible with some antivirus

Disable the "web-proxy" integrated some antivirus (if trend-micro). This function uses a white/black list which is recoverable on live servers TrendMicro (backup30.trendmicro.com, etc..) And analysis/validates every request for a site... It is activated by a user rights limited, to avoid disadvantage to this feature incompatible with proxies of ALCASAR, it is best to stop the service "Trend Proxy Service" and restart the station.

C) Windows Stations previously connected to a public hotspot

When a system connects to a "public hotspot", it provides network parameters and a "lease" which determines the validity time of these parameters. Windows XP stations do not reset these settings during a reboot. Thus, even if they change network, they will come with Hotspot previous settings. This problem is recognized by Microsoft that offers the following solution: force 'by hand' renewal application network settings via the command: « *ipconfig /renew* ».

d) Stations Windows fixed address

It is <u>necessary</u> to add the DNS suffix "localdomain" (network configuration + "advanced" + "heading dns").

e) Can not navigate while you access the portal page (http://alcasar)

This can occur after a complete reinstallation of the portal or after an update with change server certificate. Browsers have then the following pages when they attempt to join a website:

This is due to the fact that browsers try to authenticate the portal ALCASAR using an old certificate. On browsers, we must remove the old certificate ALCASAR ("tools" + "Internet Options", tab "content" button "Certificates" tab "root certification authorities") to replace the latter as described in § 2.3.1.

f) Can not navigate after completing the "trusted sites"

ALCASAR verifies the validity of domain names entered in this section (cf. § 3.7.a). If a domain name is not valid, the service 'chilli' can no longer start. Then change the domain name with a problem and restart the service 'chilli' via the command « *service chilli restart* ».

g) Overload memory and system

The Linux system always tries to exploit the maximum RAM. On the home page management center, the bargraph indicating the use of physical memory can regularly be found beyond 80% and appear red. This is normal.

If the system needs more memory, it will use the swap. This swap is an area of the hard disk operates as RAM (but 1000 times slower). If you find that the system uses swap space (> 1%), you can consider increasing the RAM to significantly improve system responsiveness especially when the filter module and domain URL is activated

You can view the system load on the home page of the management center in the 'System / load system, or console using the command « *top* » ou « *uptime* » :

3 values shown represent the system load average for the last 5 and last 15 minutes. The load average is the number of processes waiting for CPU usage.
 These values are normally less than 1. A value greater than '1 .00' results under-sizing of the server

(especially if it affects the three values (pavload included in the length).

• Search process that monopolizes a large percentage of the load (command « *top* »).

11. <u>Security</u>

On consultation network, ALCASAR is the way to control Internet access. It also helps protect the network vis-à-vis the outside or vis-à-vis a pirate house. To this end, it includes:

- protection against theft of identifiers. The authentication flow between devices and users ALCASAR are encrypted. Passwords are stored encrypted in the database;
- protection against disconnection omissions. The attribute "time limit of one session" (cf. § 3.1) allows a user to disconnect automatically after a set time;
- protection against outages (network or equipment consultation). Users whose equipment does not respond consultation for 6 minutes are automatically disconnected;
- protection against session hijacking spoofing network settings. This spoofing technique exploits the weaknesses of protocols "Ethernet" and WIFI. To reduce this risk, ALCASAR tamper incorporates a process is running every 3 minutes (*alcasar-watchdog.sh*);
- protection bootloader portal (GRUB) password. This password is stored in the file « /root/ALCASAR-passwords.txt ».

The mere presence of ALCASAR not guarantee its absolute security against all threats, including the threat of internal (pirate on the network of consultation).

In most cases, this threat remains very low. Without being paranoid if you need high security, the following measures can improve the overall security of your system.

11.1. On ALCASAR

- Choose a password "root" robust (you can change it by running the command « *passwd* »);
- Protect your PC "ALCASAR" and ISP's equipment to prevent unauthorized access, theft or installation of equipment between the box and ALCASAR ISP (indoors, lock, etc.).
- configure the BIOS so that <u>only</u> the internal hard disk is bootable. Set a password to access the BIOS setup.

11.2. <u>On the consultation network</u>

a) Network type "hotspot"

These networks are "open" in nature and they often exploit WIFI technology:

- on WiFi access points (AP) Enable WPA2 encryption "personal." This avoids listening WIFI traffic by a user (even if the key is the same for everyone). You can choose a simple WPA2 key as your organization name for example;
- on Ethernet switches, enable "DHCP snooping" on port operated by ALCASAR well as the interswitch ports. This will prevent false DHCP servers (Fake DHCP servers).

b) Controlled networks

On these networks, the stations must be protected by physical measures to ensure their integrity. Physical access to network consultation must be secured by the following:

- disconnect unused network jacks;
- on WIFI hotspots:
 - camouflage the network name (SSID)
 - enable encryption WPA2 "personal" with a robust key;
- on Ethernet switches:
 - Enable the "lock port" (function "Port Security") to associate the MAC addresses of devices to the physical ports of switches;
 - select the "DHCP snooping" on port operated by ALCASAR well as the interswitch ports. This will prevent false DHCP servers (Fake DHCP servers).

Equipment consultation can (should) incorporate several security features such as locking the BIOS setup and office, antivirus, automatic update security patches (patch), etc.. To facilitate downloading security patches or updated antivirus (cf. § 7), ALCASAR may authorize equipment to automatically connect without authentication on sites specifically identified.

If you want to set up stations consultation free access, it may be worth your press products ensuring both the protection of the privacy and security consultation station (station type "cafe"). These products allow the user to partition in a sealed environment. At the end of a session, the user environment is clean.

- Stations for Linux, you can install the product "xguest" (it is provided natively in the case of Mandriva, Fedora and RedHat)
- For stations on Windows, follow this link to the Microsoft TechNet ©: « <u>http://technet.microsoft.com/fr-fr/library/gg176676%28WS.10%29.aspx</u> »

Educate users to change their password and they do not disclose their identifiers (they are responsible sessions a "friend" to whom they have supplied).

12. Annexes

12.1. Useful commands and files

The administration of ALCASAR is used directly in a terminal command line (as 'root'). These commands all start with "alcasar-...". All these commands (shell scripts) are located in the directories « /usr/local/bin/ » and « /usr/local/sbin/ ». Some of them rely on the central configuration file ALCASAR (« /usr/local/etc/alcasar.conf »). With the argument "-h", each command lists the options it has.

- alcasar-bl.sh {-on/-off} : enables / disables the filtering domains and URL;
 - {-download} : download and apply the latest version of the BlackList Toulouse;
 - {-adapt} : adapt the BL to ALCASAR architecture ;
 - {-reload} : activate the BL freshly downloaded.
- alcasar-bypass.sh {-on/-off} : active mode on / off « BYPASS » ;
- alcasar-CA.sh :creates a local CA and server certificate. Requires restarting the Apache web server (service httpd restart);
- alcasar-conf {-apply} : apply the network settings according to the configuration file;
- alcasar-dg-pureip.sh {-on/-off} : enables / disables the filtering of URLs containing IP addresses (instead of a domain name);
- alcasar-havp.sh {-on/-off} : enables / disables the antivirus filtering flows WEB;
- {-update} : am updating the knowledge base of antivirus(clamav) ;
- alcasar-https.sh {-on|-off} : enables / disables the encryption authentication flow;
- alcasar-load-balancing.sh : script for aggregating several distinct internet access. To run this script must be set in order to take into account the location, number and weight of the bridge (box) available.
 This script is not running automatically at server startup, once validated, can be added in the file /etc/rc.local under the line « touch /var/lock/subsys/local ». To verify proper operation, run the command: ip route.
- alcasar-logout.sh {username} : disconnect users <username> all its sessions;
 {all} : disconnects all connected users;
- alcasar-mysql.sh {-import fichier_sql.sql} :imports a user base overwrites the existing
 - {-raz} : reset the user base;
 - {-dump} : create an archive of the current user base in« /var/Save/base » ;
 - {-acct_stop} : stopsessions open accounts;
- alcasar-nf.sh {-on/-off} :enables / disables the filtering of network protocols;
- alcasar-rpm-download.sh : compares the version ALCASAR active with the latest version available on the Internet;.
- alcasar-safesearch.sh {-on/-off} : active/désactive le filtrage « mineur » major search engines;
- alcasar-version.sh : compares the version ALCASAR active with the latest version available on the Internet;

Each service provided by the server is supported by a "daemon", which is managed automatically start:

- View the status of a particular daemon (works for most daemons) /etc/init.d/<nom du service> status
 Restart / stop a daemon:
- /etc/init.d/<nom du service> {start|stop|restart|reload}

Info : a super daemon checks every 10 minutes service status ("*alcasar-daemon.sh*").

If you need to edit a file, you'll probably need to know some basic features of the text editor "vi". You can then carefully press you a summary of common commands on the site: <u>http://wiki.linux-france.org/wiki/Utilisation_de_vi</u>.

Sauvegarder un fichier - quitter vi w sauvegarde le fichier (penser à write) wq sauvegarde le fichier et quitte vi (write and quit) équivallent à :x q quitte vi sans sauvegarder les modifications (quit) q! quitte vi sans sauvegarder les modifications (quit) q! quitte immédiatement, sans rien faire d'autre w <nom_de_fichier> sauvegarde le fichier censer à write) w sauvegarde le fichier (penser à write) wq sauvegarde le fichier et quitte vi (write and quit) équivallent à :x quitte vi sans sauvegarder les modifications (auit)</nom_de_fichier>	Copier-Coller Y copie une ligne, donc la place dans un tampon, pour pouvoir ensuite la coller (yank, tirer) nY copie n lignes p colle les lignes après le curseur (paste, coller) Annuler ou répéter des modifications u annule la dernière modification (undo, défaire) (un point) répète les dernières modifications	i active le mode insertion Supprimer du texte x supprime un caractère (« faire une croix dessus ») dd supprime un ligne ndd supprime n lignes
q! quitte immédiatement, sans rien faire d'autre w < <i>nom_de_fichier</i> > sauvegarde le fichier sous le nom < <i>nom_de_fichier</i> >	Rechercher et rem /motif recherche motif en allant vers la fit n répète la dernière recherche (next, N retourne au résultat de la précédent	p lacer n du document suivant) te recherche effectuée

%s/motif/motif2/g

recherche le motif et la remplace par motif2

12.2. <u>Authentication exceptions helpful</u>

The following values allow network devices to access WEB sites without authentication process in order to connect to the following services:

- testing connectivity of the Internet,
- updated Microsoft system,
- update "TrendMicro" and "clamav" antiviruses,
- test client version of mozilla and its modules,
- ...

Sites, @ IP or URLs are configurable through the management interface or directly in the following file *"/usr/local/etc/alcasar-uamallowed"*:

uamallowed="activation.sls.microsoft.com" uamallowed="www.msftncsi.com" uamallowed="crl.microsoft.com" uamallowed="download.microsoft.com" uamallowed="download.windowsupdate.com" uamallowed="go.microsoft.com" uamallowed="ntservicepack.microsoft.com" uamallowed="stats.update.microsoft.com" uamallowed="stats.update.microsoft.com" uamallowed="update.microsoft.com" uamallowed="update.microsoft.com" uamallowed="update.microsoft.com" uamallowed="pccreg.trendmicro.de" uamallowed="pmac.trendmicro.com" uamallowed="tis16-emea-p.activeupdate.trendmicro.com" uamallowed="update.nai.com" uamallowed="download.mozilla.org"

Domains are also configurable via the management interface or directly in the file: "/usr/local/etc/alcasar-uamdomain": uamdomain=".download.microsoft.com" uamdomain=".download.windowsupdate.com" uamdomain=".ds.download.windowsupdate.com" uamdomain=".microsoft.com" uamdomain=".update.microsoft.com" uamdomain=".update.microsoft.com.nsatc.net" uamdomain=".windowsupdate.com" uamdomain=".windowsupdate.com" uamdomain=".windowsupdate.com" uamdomain=".windowsupdate.microsoft.com" uamdomain=".trendmicro.com" uamdomain=".activeupdate.trendmicro.com" uamdomain=".akamaiedge.net" uamdomain=".akamaiedge.com"

uamdomain=".clamav.net"

It is necessary to restart the service chilli if files are changed directly.

12.3. Sheet of User

Internet access control has been implemented in your organization through a portal ALCASAR. When your browser tries to connect to the Internet, the following login window identifies you. Case is taken into account ("smith" and "Smith" are two different users).

When authentication is successful, the window "pop-up" is presented next. It allows you to disconnect from the portal (closed session). This window provides information on the rights granted to your account (expirations, download limits, list of recent connections, etc.)..

If this window is closed when you want to disconnect, simply enter "logout" in the URL of your browser.

If connection fails, a message can know the cause: Account expired, download

volume reaches maximum, attempting to connect to the outside slots allowed, etc..

You can access the administration interface of your account (login/logout, change your password, integration of security certificate in your browser) by entering "ALCASAR" in your browser.

The portal has a annualware protecting flows WEB. It incorporates a filtering device sites whose content may be objectionable. It also helps to know when the Internet connection does not work (equipment failure or operator failed link). The following pages are displayed:
